

Notifier

WhatsApp for ERPNext — User Guide

Send WhatsApp from ERPNext through WuzAPI (whatsmeow) · QR pairing · No per-message fees

Frappe / ERPNext → WuzAPI (whatsmeow) → WhatsApp

1 Overview

Notifier connects your ERPNext site to WhatsApp. Instead of paying per message through the official API, it drives **WuzAPI** — a self-hosted gateway built on the `whatsmeow` library — which links to WhatsApp by scanning a QR code, exactly like WhatsApp Web.

With it you can:

- Link one or more WhatsApp numbers (“instances”) by scanning a QR code.
- Send messages manually to a **phone number** or a **group chat**.
- Broadcast templated messages to a contact group.
- Automatically send WhatsApp alerts on any ERPNext event using the standard **Notification** doctype (e.g. a Sales Invoice on submit), optionally with the document’s PDF attached.

Gateway

The WuzAPI gateway for this deployment runs at `https://wuzapi.manage.reformiqo.in`. You normally never open it directly — ERPNext talks to it for you.

2 First-time setup

You only do this once per site.

2.1 WhatsApp Settings

Search the awesomebar for **WhatsApp Settings** and fill in:

Field	Value
WuzAPI Base URL	<code>https://wuzapi.manage.reformiqo.in</code>
WuzAPI Admin Token	the gateway admin token (kept by your administrator)

Save. That’s the whole configuration — every instance you create is registered with the gateway automatically.

3 Connect a WhatsApp number

Each WhatsApp number you send from is a **WhatsApp Instance**.

1. Open **WhatsApp Instance** → **New**. Give it a **Label** (e.g. `khan`) and the **Phone Number** with country code (e.g. `2206084445`). Save.
2. Click **Refresh QR Code**. A QR image appears on the form.

3. On the phone, open **WhatsApp** → **Linked Devices** → **Link a Device** and scan the QR.
4. Once paired, the status badge turns **Open** and the QR disappears.

Tip

Status refreshes on its own every couple of minutes, and whenever you open the instance. You can also press **Check Connection** to refresh it instantly.

3.1 Check Connection & group sync

The **Check Connection** button does two things:

- Reads the live connection state from the gateway and updates the badge.
- If the number is connected, it **fetches every WhatsApp group** that number belongs to and saves them into the **WhatsApp Group** list.

Run it once after pairing so your groups are available to pick when sending.

4 Send a message manually

Open **WhatsApp Message** → **New**.

1. Pick the **Instance** to send from.
2. Choose **Send To**:
 - **Phone** — type the number in **TO** (with country code).
 - **Group** — pick a **WhatsApp Group** (only that instance's groups are shown).
3. Set **Content Type** (`text` , `image` , `document` , `audio` , ...). For media, use **Attach** to upload the file.
4. Type the **Message** and Save — it sends on save.

The **Message ID** field fills in once WhatsApp accepts it, and every message is kept as a record (your communication log).

Media & audio

Attachments are uploaded to WhatsApp as data, not links. Audio should be Opus/OGG; other formats may be rejected by WhatsApp.

5 Broadcasts

Use **WhatsApp Broadcast** to send a templated message to everyone in a contact group:

1. Create a **WhatsApp Template** with your message. Use `{{ fieldname }}` to pull values from each contact (e.g. Hi `{{ first_name }}`).
2. Create a **WhatsApp Broadcast** → choose the **Instance**, **Contact Group** and **Template** → **Submit**. Each recipient gets an individual message.

6 Automation — WhatsApp as a Notification channel

This is the powerful part: WhatsApp is now a **channel** on ERPNext's built-in **Notification**, so you can trigger messages on any document event with conditions and Jinja — no coding.

1. Open **Notification** → **New**. Set **Channel** = **WhatsApp**.
2. Pick the **WhatsApp Instance** to send from.

3. Choose **Send To**:

- **Phone** — set **Recipient Phone Field** to the docfield holding the number (e.g. `contact_mobile`), or add a **Recipients** row → “Receiver By Document Field”.
- **Group** — pick a **WhatsApp Group**.

4. Under **Filters**, set **Document Type** (e.g. `Sales Invoice`), **Send Alert On** (e.g. `Submit`), and an optional **Condition**.

5. Write the **Message** body. Jinja works: `{{ doc.customer_name }}`, `{{ doc.grand_total }}`, etc.

6. Optional: tick **Attach Print** and pick a **Print Format** to also send the document’s PDF.

Example — WhatsApp the customer when an invoice is submitted:

Setting	Value
Channel	WhatsApp
WhatsApp Instance	khan
Send To	Phone
Recipient Phone Field	contact_mobile
Document Type	Sales Invoice
Send Alert On	Submit
Message	Hi {{ doc.customer_name }}, invoice {{ doc.name }} for {{ doc.grand_total }} is ready.
Attach Print	☒ (Standard print format)

7 Reference

7.1 Instance status

Badge	Meaning
Open	Connected and logged in — ready to send.
Connecting	Session started, waiting for you to scan the QR.
Closed	Not connected / logged out — press Refresh QR Code and scan again.

7.2 Troubleshooting

Symptom	Fix
Status stuck on Connecting after scanning	Press Check Connection . It reads the true state from the gateway.
Group dropdown is empty	Run Check Connection on the instance first to sync groups.
Message sent but recipient got nothing	Confirm the number is a real WhatsApp account and includes the country code.
Instance went Closed on its own	The phone unlinked the device or lost the session — re-scan the QR.
